

OAuth 2.0

- Uses tokens
 - ↳ includes username, expiration time, authorization information, etc.
- when using it, your credentials NEVER go to the third-party app
- SEPARATE Authorization (Auth) Server
 - ↳ takes creds
 - ↳ supplies token
- Resource Server
 - validates token, supplies content
- ADVANTAGES
 - don't have to manage credentials
 - can just pass the token around our various services for auth
 - don't have to code the creation and validation of tokens
- DISADVANTAGE:
Less control over auth mechanism
